#### Learning goals:

- Understand Jupyter
- Understand Datahub
- Python Tutorial (Lab)
- Git review

#### Discussion 1

COGS 108 Summer Session 1, 2023

Discussion slides and materials adapted from Sam Lau (TA: WI20)

#### Plan

```
Technical Discussion Section (2-2:50pm) ( recorded)
Intro
Tools (anaconda, jupyter, git/github)
Demos (Datahub, git)
Project discussion
```

# Technical Discussion Sections Section Philosophy

- Attendance is not required
- Reasons to never miss the discussion sessions:
  - Demos to help you set up and start working
  - Hands-on experience and personalized guidance
  - Time to practice technical aspects of the course
  - Discussion is not supposed to be a monologue Please ask questions
  - Condensed information >> searching the infinite www.

#### Zoom format

- Review -> Demo -> Lab & Q/A.
   Please mute your microphone, but feel free to unmute and ask questions!
- If you're more comfortable with text -> Keep asking questions on chat
- We will take up assignment specific questions towards the end of Discussion or during OH.

## Programming

- This course assumes basic programming knowledge...but not much
- Resources:
  - codeacademy
  - Start Here: <a href="https://github.com/COGS108/Tutorials/blob/master/01-Python.ipynb">https://github.com/COGS108/Tutorials/blob/master/01-Python.ipynb</a>
  - Python in detail: <a href="https://jakevdp.github.io/PythonDataScienceHandbook/">https://jakevdp.github.io/PythonDataScienceHandbook/</a>
  - Pandas: <a href="https://www.dataschool.io/python-pandas-tips-and-tricks/">https://www.dataschool.io/python-pandas-tips-and-tricks/</a>
  - Git: <a href="https://guides.github.com/activities/hello-world/">https://guides.github.com/activities/hello-world/</a>
- Cheatsheets
  - Google: 'python cheatsheet', 'pandas cheatsheet', 'git cheatsheet' (find one that's good for you)

#### Anaconda

The Data Science Toolkit – contains Python and data science libraries (including jupyter notebooks)

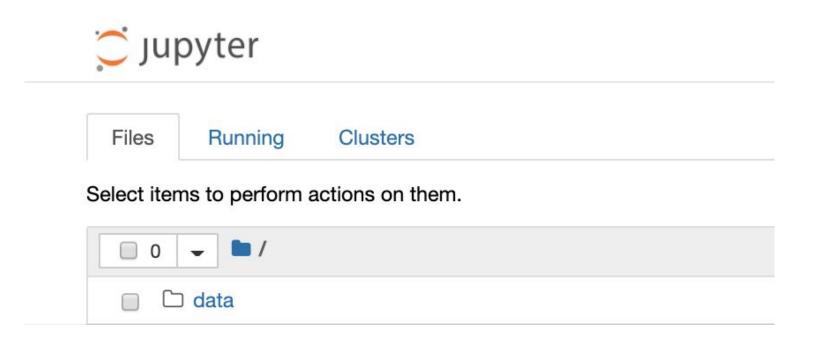

- Download: <a href="https://www.anaconda.com/products/individual">https://www.anaconda.com/products/individual</a>
- Installation: <a href="https://docs.anaconda.com/anaconda/install/">https://docs.anaconda.com/anaconda/install/</a>
- Verify installation:
   <a href="https://docs.anaconda.com/anaconda/install/verify-install/">https://docs.anaconda.com/anaconda/install/</a>
- Make sure anaconda is added to the system path: For mac: export PATH="/usr/local/anaconda3/bin:\$PATH"

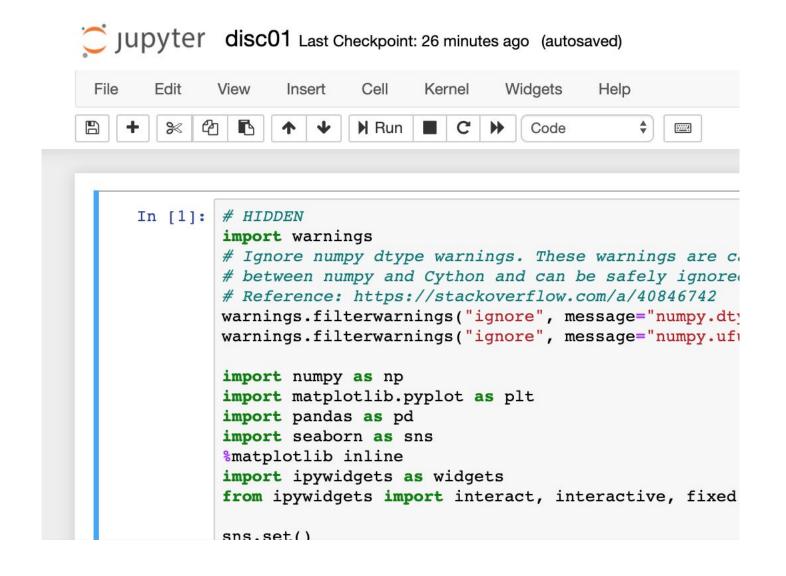

### Jupyter

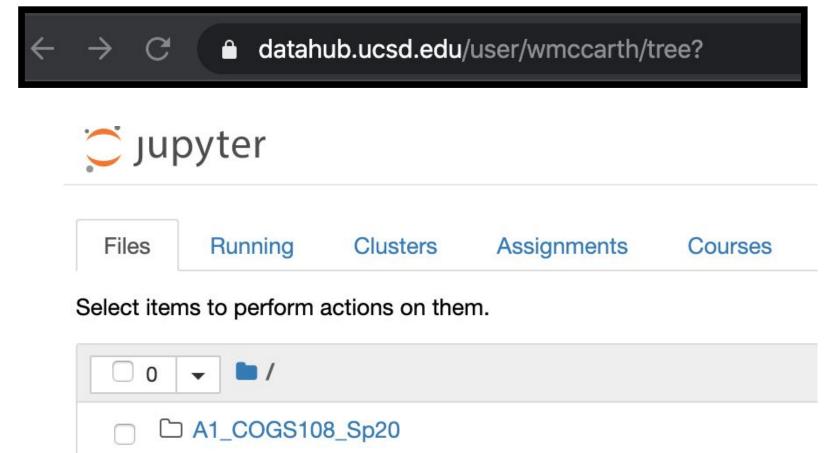

- Python code is run on a python interpreter
- Jupyter is a program that creates an interface for typing python code in a browser, that also runs that code in a python interpreter
- What does this mean?!
  - Jupyter is a way of running python programs from a browser (like chrome) (hooray!)

### datahub

- Jupyter runs python code in a browser.
  - But Jupyter is itself just a program that's running on a computer somewhere.
- datahub lets you interact with Jupyter that's running somewhere else.
- What does this mean?!
  - You don't need to worry about installing Jupyter
  - You can use datahub to create and run python programs (online)
  - You can use this interface to fetch and submit assignments

#### Checking your work (in general on datahub)

- The tests built into the notebook are (very) minimal.
  - To write your own tests, add a cell with assert statements below your code.
- Make sure to click Validate before turning in your notebook!
  - This replicates what our autograder will do.
  - Hidden tests on the autograder aren't validated.
- Make sure to click submit once you're ready to submit.
  - And don't click submit after the deadline unless you mean to submit late.

### Working on your labs/assignments

- Log into datahub.ucsd.edu
- Go to Assignments tab
- 'fetch' assignments you have access to -> Submit after completion

Today's Discussion Lab: D1 (python)

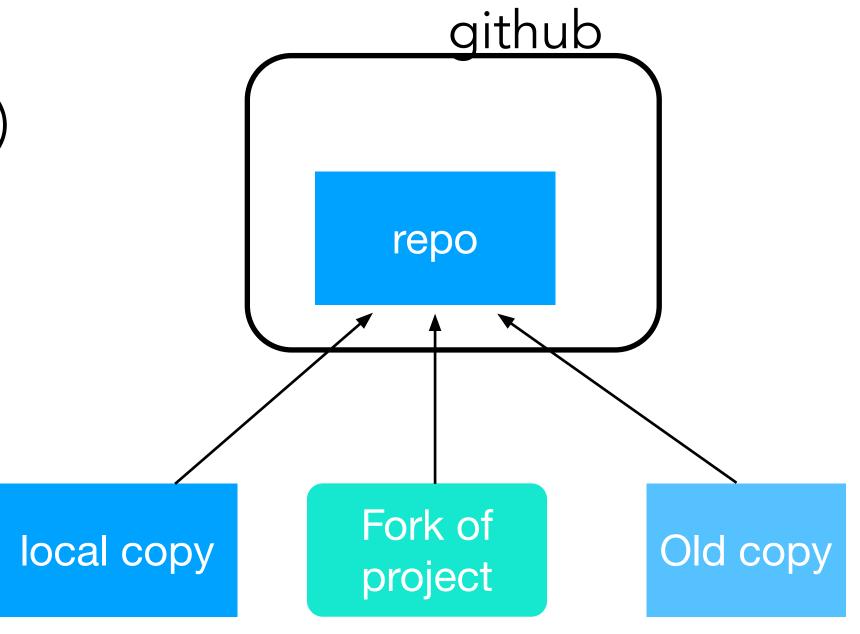

### git

#### Version control system!

- Go to <a href="https://git-scm.com/downloads">https://git-scm.com/downloads</a>
- Choose your Operating System (Windows/OS X/Linux)
- Follow the steps specific to your OS
- Verify installation: In terminal type "git --version"

### What is git + GitHub?

- Somewhere online to store a copy of a project (Github)
- Plus a tool to interact with this copy (Git)
  - Command line and desktop versions
- A way of keeping track of changes you make to this project

### Why use git + GitHub?

- Collaboration: Git allows you to work on code projects with other people. It's the preferred tool for many projects, like...
  - Python: <a href="https://github.com/python/cpython">https://github.com/python/cpython</a>
  - Jupyter: <a href="https://github.com/jupyter/">https://github.com/jupyter/</a>
  - COGS 108:
    - https://github.com/drsimpkins-teaching/cogs108
    - https://github.com/COGS108/
- Backup
- Version control (undo on a large scale)
- Code reuse

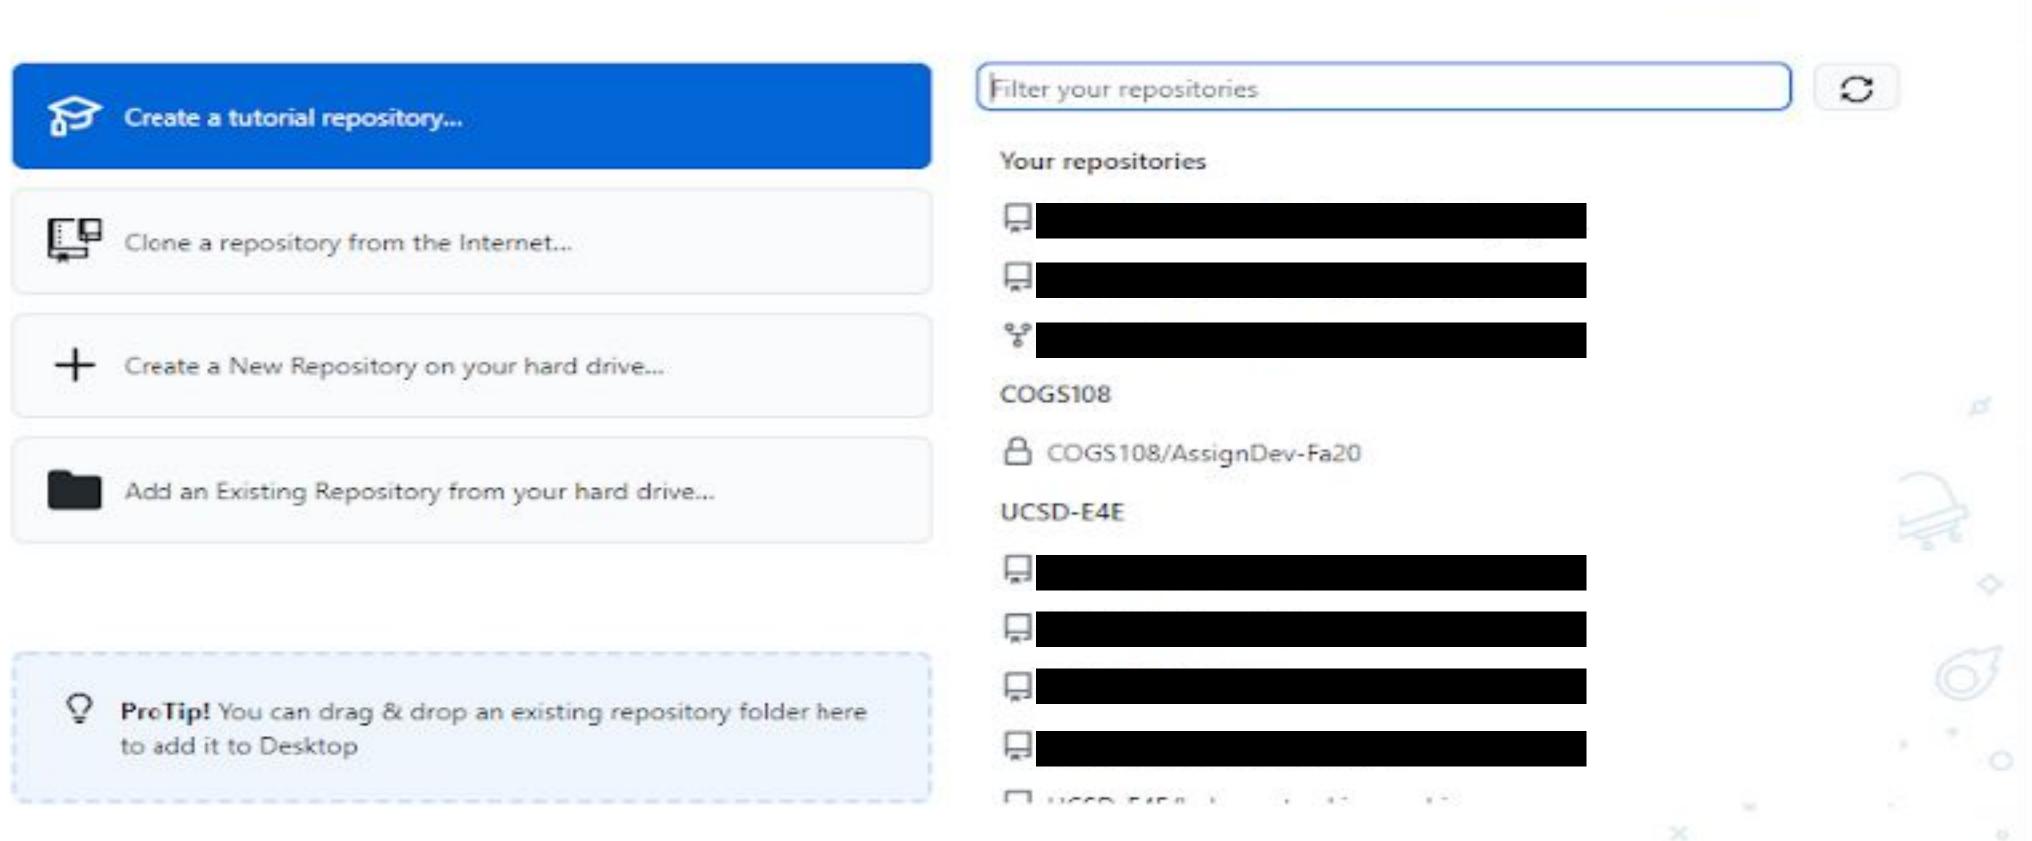

# Part 1 Walkthrough

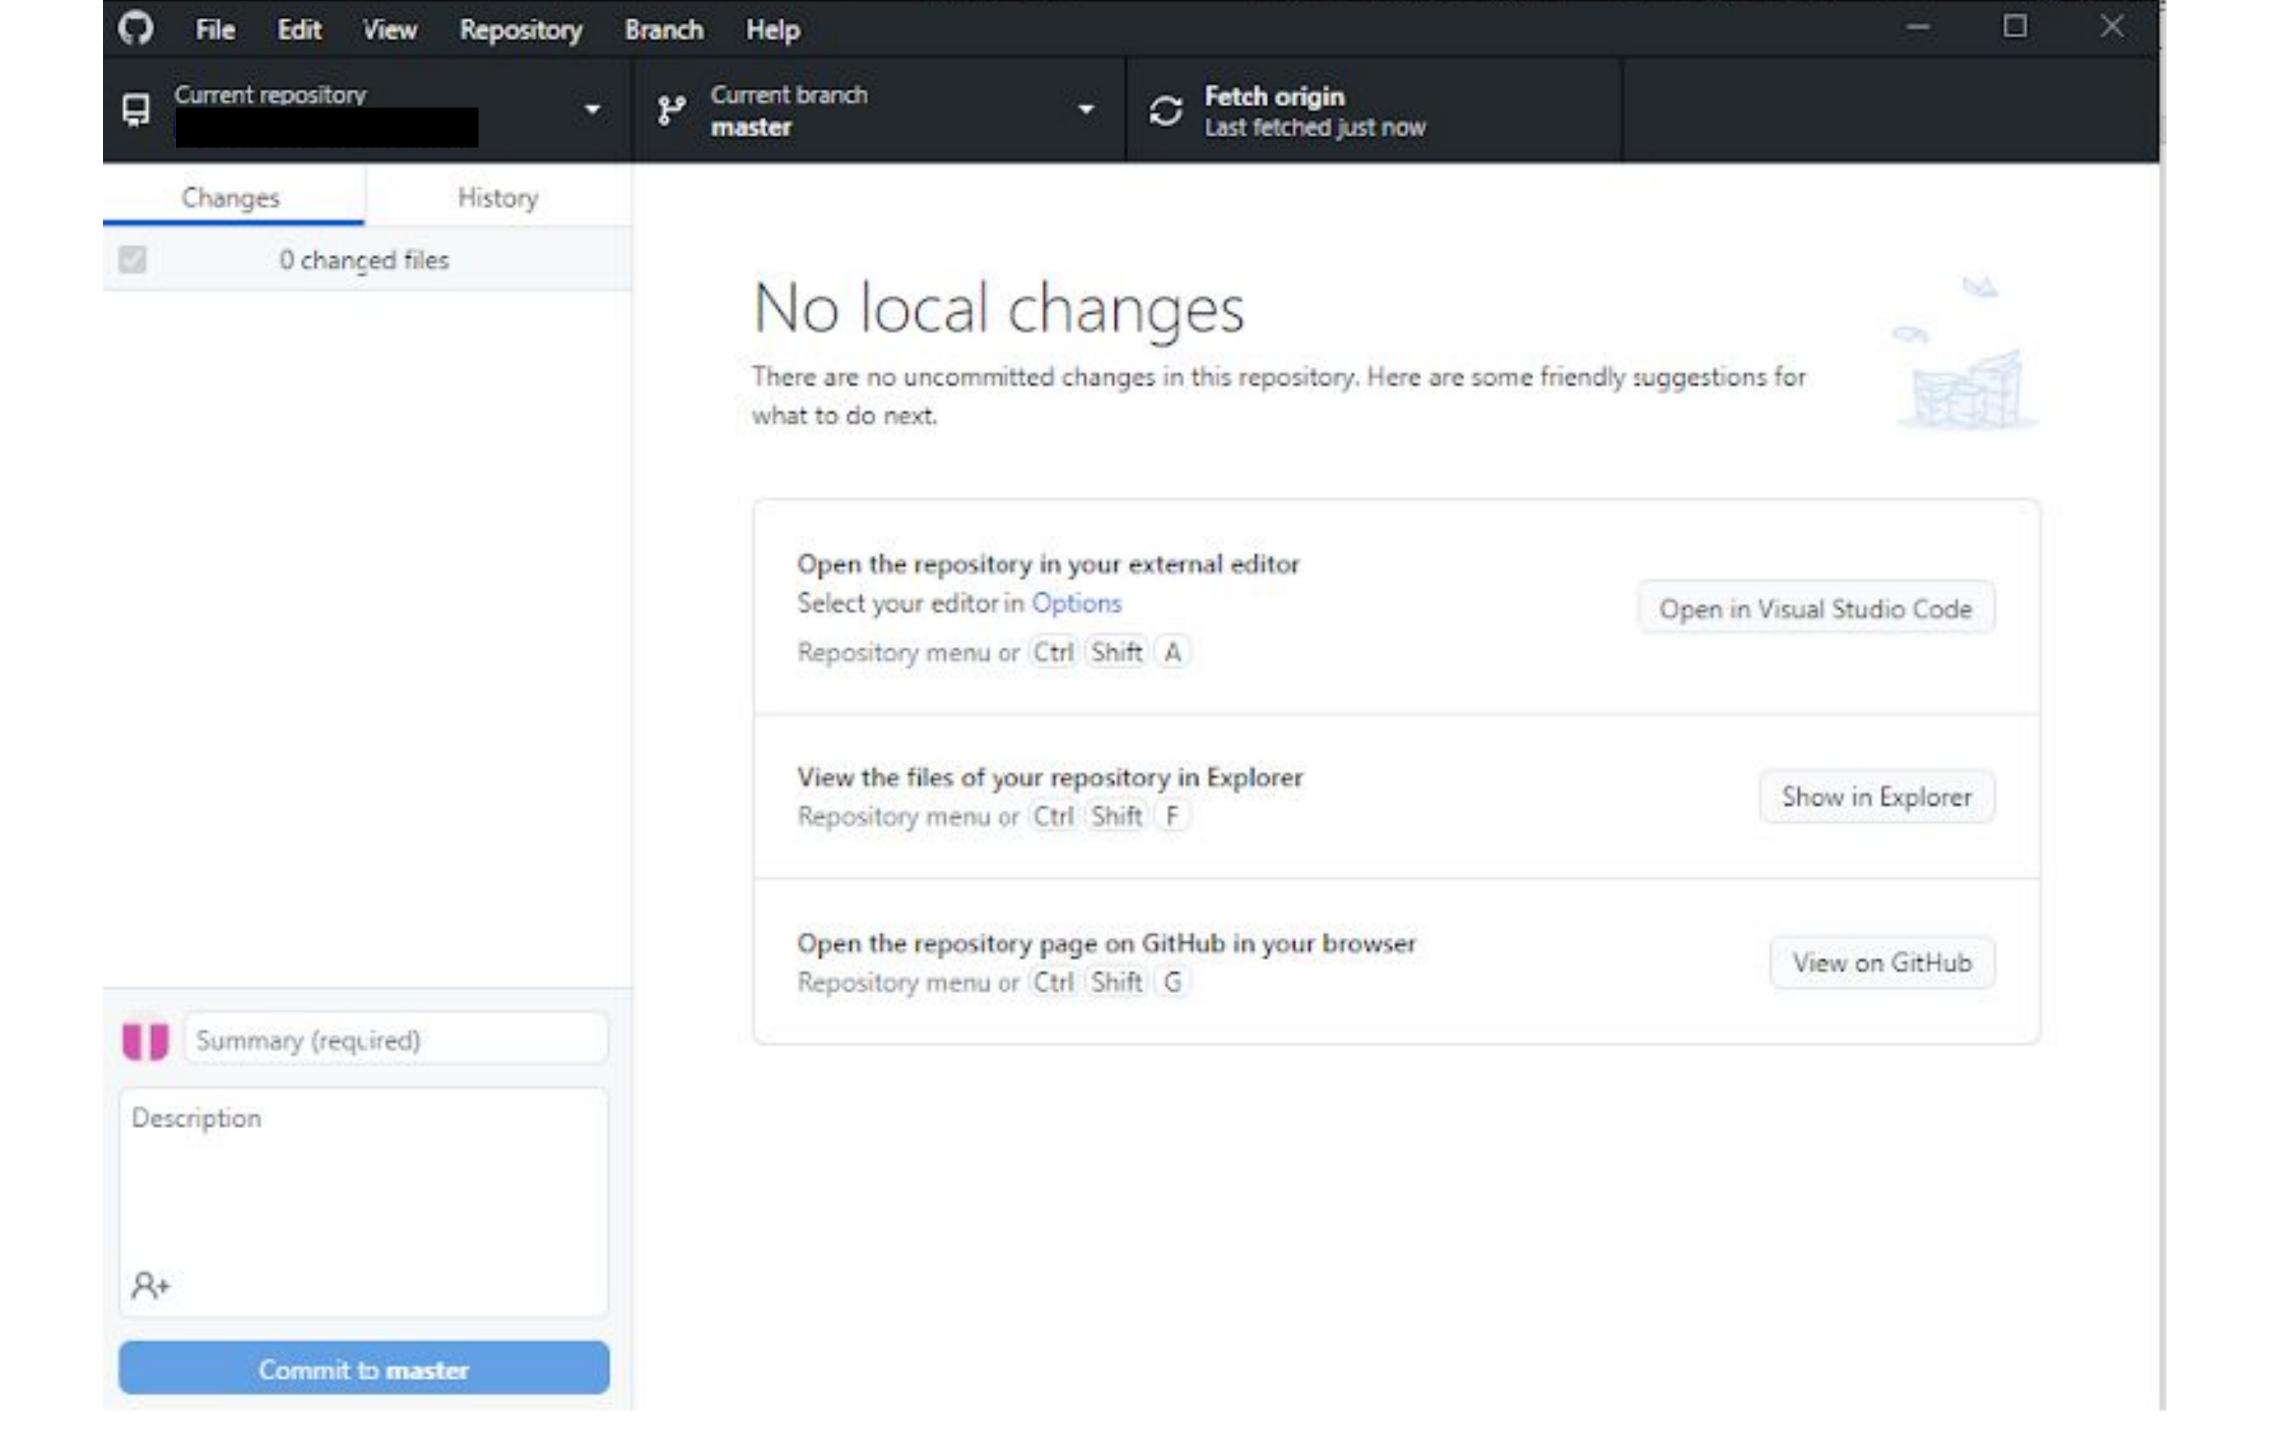

### Git Stage, Commit and Push (Demo)

- Cloning a repo on your local machine
- Working on your remote repo (making changes to files)
- Stage, commit and push these changes to your Github repo
- Commands you should know:
  - Git clone
  - Git status (not really needed but really helpful)
  - Git add
  - Git commit
  - Git push

Help

### Checking your work for Part 1

- Check that your COGS108\_Repo has a README and a .gitignore file. (Repo must be on your account.)
- Go to COGS108/MyFirstPullRequest, click Pull requests.
  - Make sure your PR shows up in that list.
  - Make sure your PR has the right title.
  - Make sure your PR has the right file (correct name).
